Missouri State University

At the Request of
The Commission on Racial and Ethnic Fairness, Supreme Court of Missouri

Fall 2024

ACKNOWLEDGEMENTS

Thank you to the Commission for Racial and Ethnic Fairness (CREF) for giving Missouri State University the opportunity to continue this research.

Thank you to Judge Lisa Hardwick and CREF Executive Director Stephanie White-Thorn for their leadership, regular communication, and feedback throughout this project.

Thank you to Dr. Mark Ritchey and his team at the Office of State Courts Administrator (OSCA) for their assistance on data issues.

Thank you to Health Forward who provided grant assistance for Phase II of this research project.

Thank you to Missouri State University School of Criminology and Criminal Justice graduate assistants, Samara Mizutani Cesar, Samantha Trowbridge, Lauren Sanders, and Jane McCormick for their assistance in this research.

Thank you to Dr. Brett Garland and Dean Shawn Wahl of Missouri State University for their support of this project.

EXECUTIVE SUMMARY

In July 2021, the Missouri Supreme Court's Commission on Racial and Ethnic Fairness (CREF), led by Judge Lisa Hardwick and Judge Jon Gray, entered into an agreement with the School of Criminology and Criminal Justice at Missouri State University to perform independent research that examines statewide racial disparities, explicit and/or implicit bias, and current training/procedures that are used to address such issues in the Missouri court system.

The Missouri State University research team, led by Drs. Jennifer LaPrade and Ethan Amidon, began the research in September 2021 and completed the first phase of the study in February 2023. Phase I of this study included the analysis of over six million state adult criminal court records that ended in conviction, the distribution of an online survey and the analysis of 1,202 responses from Missouri court actors, and the analysis of the transcripts from in-depth interviews with 49 people who work in the Missouri court system. The results from Phase I are presented in a report that has been made [publicly available](#) online.

In the second phase of this project, the research team extends the initial analysis of adult court records that began in the first phase of the study. More specifically, one of the main limitations associated with the analysis of adult cases that ended with a conviction in Phase I was that the research team could not identify the role that the court system played in producing the disparities that were noted within this report. To address this limitation, Phase II examines all adult criminal cases in Missouri from 2010 to 2022, regardless of the outcome of the case. Since the records used in Phase II are not limited to cases that ended in conviction, we are better able to isolate the role that the court system has played in producing the disparities for Black defendants identified in Phase I.

Furthermore, we continue to examine the presence of racial/ethnic biases in the Missouri court system by expanding our analysis to include juvenile and treatment court records from 2018 to 2022. One of the primary advantages associated with the examination of treatment and juvenile records is that these datasets contain far more information about the defendant and their crimes in comparison to the adult criminal court records. Since these datasets contain more individual- and case-level information, the research team is able to include variables that account for these additional factors in the statistical models to see if defendant's race/ethnicity is a significant predictor of treatment and juvenile outcomes. The inclusion of additional factors that could be associated with treatment and juvenile outcomes

will increase our ability to accurately speak to the role that race/ethnicity plays in shaping these sentencing outcomes.

Data Collection

All the Missouri court data used in Phase II of this project came from the Office of State Court Administration (OSCA). These data included almost 14 million adult criminal records, over 132,000 juvenile referral records, and over 12,000 treatment court records. The names of all defendants were removed from records before the research team received the datasets.

Juvenile Record Results

The dataset used in this study contains 132,801 juvenile cases from 2018 to 2022 across all jurisdictions in Missouri. Similar to the racial disparities that were highlighted in Phase I, the examination of several juvenile outcomes (referrals, law violations, status offenses, and detentions) revealed significant disparities among Black defendants across the entire state of Missouri and most jurisdictions.

We also found that there was considerable variation in terms of the magnitude of the Black disparities when examining each outcome across the jurisdictions. While these racial disparities could possibly be evidence of racial bias in Missouri Courts, these disparities could also be attributed to other factors, including law enforcement practices and/or broader societal issues.

However, the juvenile records contained more individual- and case-level information in comparison to the adult criminal court records, which allowed us to perform a more thorough analysis of the relationship between defendant's race/ethnicity and juvenile sentencing outcomes. More specifically, we examined whether the race/ethnicity of the defendant is significantly related to two detention outcomes while simultaneously accounting for additional factors in the models, such as the defendant's demographic characteristics, their risks and needs, and their prior criminal history.

The results from these analyses indicated that Black juveniles were significantly more likely to be detained in comparison to white defendants. The findings also showed that Black defendants were detained for significantly longer periods of time in comparison to white defendants. With this deeper analysis, we can conclude that race plays a role in juvenile processing in Missouri.

Treatment Court Record Results

The second phase of the study also involved the examination of 12,293 treatment court cases from 2018 to 2022. The following types of treatment courts were included in the dataset: adult drug courts, juvenile drug courts, DWI courts, veteran courts, and family courts. Similar to the juvenile dataset, the treatment court records included additional individual- and case-level information that enable us to perform a more thorough analysis of the role that race/ethnicity plays in treatment court outcomes, such as whether the offender graduated/completed the program or whether the defendant was administratively terminated.

The results from these analyses indicated that Black treatment court participants were significantly less likely to graduate/complete the program in comparison to white participants. Additionally, we found Black participants were also significantly more likely to receive an administrative termination in comparison to white participants.

With this deeper analysis, we can conclude that race plays a role in Missouri treatment court outcomes.

Homicide Record Analysis

Another important aspect associated with Phase II involved the examination of whether a defendant's race/ethnicity was associated with homicide outcomes in Missouri.

Between 2010 and 2022, there were 7,261 individuals charged with homicide in the adult criminal dataset. Out of all the individuals charged with a homicide, 4,760 defendants (~65 percent) were convicted, while 1,985 individuals (~28 percent) had their cases dismissed by either a prosecutor (1,748) or the court (237). The role of defendant's race/ethnicity in shaping sentencing outcomes is examined across four dependent variables, which included conviction, dismissal, sentence length, and whether the defendant received the death penalty or life in prison.

Additional information was also included in the models to account for individual- and case-level factors that could impact sentencing in homicide cases. For instance, these analyses included the age and race/ethnicity of the defendant, whether the defendant used a public defender, the number of co-defendants, and crime

severity. Additionally, we included various jurisdictional-level variables that past studies have found to be associated with aggregate sentencing outcomes.

The results from these analyses showed that Asian homicide defendants were significantly more likely to be convicted of a homicide in comparison to white defendants. The findings also indicated that Asian defendants were significantly less likely to have their case dismissed in comparison to white defendants. The findings also indicated that Hispanic defendants were significantly more likely to receive a death sentence or life in prison in comparison to white defendants, while Black defendants were significantly less likely to receive these sentences in comparison to white defendants.

The results also showed that there was no significant relationship between the race/ethnicity of the defendant and the length of their homicide sentence.

The findings from these analyses suggest that the sentences handed down to homicide defendants could be shaped by racial/ethnic bias. While we were able to account for a few additional factors in the homicide analyses, it is important to note that we would need more individual- and case-level information before we could conclude with certainty that the sentencing outcomes were the direct result of racial/ethnic bias. Based on this limitation, caution should be exercised when interpreting these results.

Examination Across the Judicial Process

Phase I of the study showed racial disparities in adult criminal convictions across most of the 33 selected jurisdictions and for nearly all the crimes that were examined in the report. As previously noted, one of the main limitations associated with these analyses was our inability to examine the role that the court system played in producing the documented disparities. To partially address this limitation, we examined 13,886,738 adult criminal records from arrest to conviction for the period from 2010 to 2022. The advantage associated with using all the adult criminal records is that it will allow us to better determine the role that the court system plays in terms of contributing to the disparities observed in the first report. More specifically, these analyses will examine how the percentage of Black defendants who received favorable outcomes (e.g. dismissals or not guilty verdicts) or unfavorable outcomes (e.g. guilty verdicts, plea deals) differs from the percentage of all Black defendants that were initially received from law enforcement.

Relying on the same 33 jurisdictions examined in Phase I, we found that the racial disparities largely remained the same when all defendants were taken into consideration. However, the results when examining favorable and unfavorable outcomes primarily show that the percentage of Blacks defendants receiving both types of outcomes was closely aligned with the overall percentage of Black defendants received from law enforcement. These results suggest that the court system is processing Black defendants in proportion to how they are received. In other words, it does not appear that the court system is the source of the Black disparities that are documented in both reports. While these results were consistent across most crimes and jurisdictions examined in this report, it is important to note that there were some increases in Black disparities in many jurisdictions, particularly when considering armed criminal action charges.

In addition to further examining racial disparities in the adult criminal court records, the research team also reexamined Black disparities across the pre- (2010 to 2015) and post-Ferguson (2016 to 2022) time periods with the new dataset. The results from the analyses that examined changes in the Black percentage across favorable and unfavorable sentencing outcomes were mixed. More specifically, the findings showed that some of the selected jurisdictions demonstrated an increase in racial disparities after Ferguson, while some of the jurisdictions showed a decrease in disparities in the post-Ferguson time period.

The examination of adult criminal records that included non-convictions largely showed the same racial disparities that were noted in the first report. However, the results when we examined favorable and unfavorable outcomes showed that the courts were processing defendants in the manner that they are received from law enforcement. Although most of the results suggest that the court system is not the source of the Black disparities, we did find evidence to suggest a reasonable likelihood that the courts contribute to the racial disparities for armed criminal action.

Conclusion & Recommendations

Overall, the results from Phase II demonstrate the presence of widespread racial disparities and racial bias in juvenile and treatment court processing. The results also show that race plays a role in longer sentences in homicide convictions.

Our results also show that the racial disparities do not change significantly throughout the judicial process. These results indicate that Missouri courts are largely processing adult criminal cases as they come in and the racial disparities begin either at the law enforcement level and/or other societal issues. However, there could be exceptions in some cases, such as armed criminal action where we saw higher levels of racial disparities as the cases advanced through the judicial process.

Additionally, we outline several recommendations at the end of the report and suggest avenues for future research.

We welcome the opportunity to continue this research and assist the Missouri Court system as it gains additional insight on these important issues.

Again, we commend the Commission on Racial and Ethnic Fairness and the Missouri Supreme Court for striving to increase fairness and justice in all courts across the state.

THE ISSUE

There have been widespread reports of anecdotal racial and ethnic bias in the Missouri criminal justice system. The Commission on Racial and Ethnic Fairness (CREF) was established by the Supreme Court of Missouri to “review current practices and recommend measures to ensure fairness, impartiality, equal access and full participation for racial and ethnic minorities who seek redress in Missouri courts.”

To pursue this goal, CREF sought an independent group of academics and attorneys to conduct an examination of Missouri courts with regard “to the existence of explicit and implicit racial bias as manifested in current rules, customs, policies, practices and procedures.” CREF was especially concerned whether people of color, particularly Black residents, received fair treatment in the Missouri courts.

Missouri State University answered the call to perform this research, with Dr. Jennifer LaPrade and Dr. Ethan Amidon, faculty from the School of Criminology and Criminal Justice, leading the project.

This research is not intended to shame anyone or bring negative attention to the Missouri court system. Instead, this research is intended to provide data and documentation on the scope and depth of potentially unfair treatment towards defendants, litigants, and employees of color.

The goal of this research is to improve fairness and justice for all in the Missouri court system.

DATA COLLECTION PROCEDURES

This section of the report provides an overview of the procedures that were used to obtain the data for Phase II. More specifically, the three datasets that were used in this phase of the study were juvenile case records, treatment court records, and adult criminal court records.

Juvenile Case Records

After our request for juvenile case records was approved by the Missouri State Judicial Records Committee, we received a dataset containing 132,825 juvenile cases nested within 89,599 juveniles between 2018 and 2022 (see Table 1). All of the juveniles' names were removed before we received the dataset. Our analysis of juvenile records begins in 2018 because we were informed that the state initiated a more systematic and reliable manner to gather the juvenile data in that year. Therefore, we requested records that began in 2018 to ensure that we relied on the most accurate juvenile data in our analyses.

Since the juvenile dataset had records at the case level, with some juveniles associated with multiple cases, we transformed the dataset to the individual level by matching the unique name identifier for each case. This resulted in 67,690 juveniles in the dataset. We then removed records with missing data (958), which yielded 66,732 juveniles in the final dataset.

Treatment Court Records

After the approval of our request for treatment court records, we received a dataset containing 12,293 treatment court cases between 2018 and 2022 (see Table 2). All names had been removed from the dataset. Similar to the juvenile records, there were substantial improvements in the methods that were used to capture treatment court records in 2018. Therefore, we examine treatment court outcomes from 2018 to 2022 to ensure that we are using the most accurate data in our analyses.

The treatment court records contain cases from multiple types of courts in Missouri, which include adult drug court, DWI court, veteran court, family court, and juvenile drug court. Although the treatment court records contain different types of courts, we examine the outcomes from all of the courts together in this report. The primary reason we avoid disaggregating the treatment court records by

**Table 1: Total Number of Cases and Individuals in
Missouri Juvenile Courts (2018 - 2022)**

Year	Number of Cases	Number of Individuals
2018	29,703	19,979
2019	28,870	19,075
2020	20,834	14,512
2021	23,317	15,850
2022	30,077	20,183
Total	132,801	89,599

**Table 2: Total Number of Individuals in
Missouri Treatment Courts (2018 - 2022)**

Year	Number of Individuals
2018	2,723
2019	2,867
2020	2,492
2021	1,972
2022	2,239
Total	12,293

the type of court is due to the very small number of offenders who participated in certain types of treatment courts, which could potentially produce misleading results.

Adult Criminal Court Records

One of the primary purposes behind the current project is to determine the extent of racial disparities in criminal court outcomes across jurisdictions in Missouri. To begin the examination of racial disparities in criminal cases, the research team initially made an official request to the State Judicial Records Committee for the Missouri court records that contained information on the disposition of these cases. After our request was approved, we received a dataset in December of 2021 that included almost six million criminal cases that resulted in a conviction across all jurisdictions in the state. The first phase of this study included an analysis of racial disparities in adult criminal convictions between 2010 and 2021.

In addition to the original database examined in Phase I, the research team made another request to the State Judicial Records Committee for all adult official records, regardless of the outcome of the case. We requested these additional records because this information will provide a clearer picture of the role that the court system played in producing the racial disparities that were noted in the previous report. Our request for these records was approved, and we received the new dataset in September of 2022.

The new dataset includes all adult criminal cases from arrest to conviction in the state of Missouri from January 2010 to September 2022. The new dataset included 13,886,738 charges, 2,541,074 cases, and 2,541,317 individuals (see Table 3) across the entire state. Similar to the first report, we examine racial disparities across 33 jurisdictions and the entire state of Missouri. More specifically, we examine disparities in favorable and unfavorable outcomes across all offenses, felonies, and misdemeanors. Additionally, we examine racial disparities related to specific charges, which include driving under the influence, domestic violence, burglary, possession of a controlled substance, and armed criminal action.

The information in the adult criminal court records dataset was also used to examine whether the race/ethnicity of the defendant was associated with homicide outcomes in Missouri. In particular, there were 7,261 individuals charged with a

Table 3: Total Number of Charges, Cases, and Individuals in Missouri Courts (2010 - 2022)

Year	Number of Charges	Number of Cases	Number of Individuals
2010	1,076,600	214,143	214,165
2011	1,071,709	208,956	208,968

2017	1,242,317	205,254	205,260
2018	1,209,190	202,501	202,517
2019	1,127,798	201,693	201,701
2020	750,042	146,918	147,017
2021	1,000,648	191,582	191,590
2022	569,467	115,096	115,100
Total	13,886,738	2,541,074	2,541,317

first-degree homicide, a second-degree homicide, and voluntary manslaughter from 2010 to 2022 in Missouri. These analyses examine whether a defendant's race/ethnicity is associated with four sentencing outcomes, which include conviction, dismissal, the length of the sentence, and whether the defendant received the death penalty or life in prison.

As we stated in Phase I of the study, although Missouri should be commended for maintaining a statewide database, there are several limitations within this database that prohibited us from directly examining whether criminal outcomes are the product of racial and/or ethnic biases on the part of courtroom actors. We reiterate these limitations again below:

1. To truly examine the official court records for signs of racial and/or ethnic bias, the data must include all variables that shape courtroom actors' decision-making. While the official dataset includes a variety of information about each case, this dataset is also missing important variables that impact courtroom outcomes, such as criminal history, offense severity, information about the victim(s), and specific details surrounding the defendant's criminal activity.
2. The research team also found that Hispanic individuals were frequently being coded as "white" in the official records. This information suggests that Hispanic individuals are likely severely undercounted in the criminal database, which could bias the results for this ethnic group. Although we include information for Hispanics when examining the results from the official court records, it is important to note that these findings must be taken with caution.
3. The dataset does not contain a unique identifier that would allow for users to differentiate between cases where the defendant was sentenced to death or sentenced to life in prison. Therefore, it is not possible at this time to examine racial differences in the imposition of death sentences using Missouri's official court records. However, we were able to obtain capital case files in a separate dataset that we received in November 2023. The analysis of those records will be available in a future report.

Based on these limitations in the adult criminal records, any attempt to examine courtroom outcomes for racial and/or ethnic bias would likely produce inaccurate and misleading results.

The following sections will present the results of our analyses of juvenile records, treatment court records, and adult criminal records that include non-convictions.

JUVENILE RECORDS RESULTS

This section of the report presents three sets of results from our examination of Missouri's juvenile records from 2018 and 2022. First, we examine Black disparities across juvenile referrals and detentions for the entire state of Missouri and all jurisdictions in the state. Second, this section examines whether a defendant's race/ethnicity is a significant predictor of being detained. Finally, we examine whether the race/ethnicity of the defendant is associated with their length of their detention.

The three research questions that guided our examination of the juvenile records were:

1. Are there similar racial disparities in Missouri's juvenile cases in comparison to those found in the Phase I adult criminal court records?
2. Is a defendant's race/ethnicity a significant predictor of juvenile detention when controlling for additional individual- and case-level information?
3. Is a defendant's race/ethnicity a significant predictor of longer juvenile detentions when controlling for additional individual- and case-level information?

Racial Disparities in Missouri Juvenile Cases

As stated in the previous section, we received a dataset containing 132,825 juvenile cases in Missouri between 2018 and 2022. The initial dataset was then transformed to the individual level, which resulted in the final dataset that contains 66,732 juveniles. Since our juvenile records had a shorter time frame in comparison to the adult records (2010 to 2022), we used five-year estimates from the American Community Survey for 2018 to 2022 to determine the percent Black for each jurisdiction. Our analysis of the juvenile outcomes is restricted to Black juveniles because the number of Hispanic, Asian, and American Indian juveniles was extremely low (even zero) in many jurisdictions.

The results in Table 4 examine the size of Black disparities across juvenile referrals, law violations (includes acts that would be defined as crimes if committed by adults), status offenses, and detentions. As shown in this table, the Black population is approximately 11 percent of the total population in Missouri. However, Black juveniles make up over 28 percent of all referrals, over 34 percent of all law violations, 21 percent of status offenses, and 42 percent of detentions.

Table 4: Racial Disparities in Juvenile Cases in Missouri (2018 – 2022)

Geographic Area Name	Percent Black (County)*	Percent Black (All Referrals)	Percent Black (Law Violations)	Percent Black (Status Offenses)	Percent Black (Detentions)

*The percent Black was calculated using the American Community Survey estimates for 2018 to 2022

**NA indicates that zero juveniles were detained in the jurisdiction.

When focusing on the results for individual jurisdictions, the disparities across the four outcomes are even greater than those reported for the entire state. For example, Blacks comprise slightly over 9 percent of the total population in Boone County; however, Black juveniles made up over 51 percent of all referrals, over 56 percent of all law violations, almost 47 percent of all status offenses, and over 60 percent of all detentions.

We also found significant racial disparities in juvenile outcomes in the largest jurisdictions in the state. For example, Blacks comprised approximately 44 percent of the total population in St. Louis City. However, Black juveniles made up almost 92 percent of all referrals, 94 percent of all reported law violations, 84 percent of all status offenses, and almost 94 percent of all detentions in this jurisdiction. Furthermore, the Black population is approximately 5 percent in St. Charles County, but Black juveniles make up 29 percent of all juvenile referrals, 31 percent of all reported law violations, 23 percent of status offenses, and almost 43 percent of all juvenile detentions.

The results in Table 4 show that there are substantial racial disparities across the four juvenile outcomes. Although we found somewhat sizable disparities across most jurisdictions, it is important to note that there were a few counties that did not report racial disparities for Black juveniles across the four outcomes.

In the next section, we examine whether a juvenile's race/ethnicity is significantly associated with the higher likelihood of detention and the amount of time that they spend detained.

Factors Associated with Juvenile Detention

To determine whether the race/ethnicity of the defendant is associated with being detained and the length of detention, we include several additional variables in the models to account for individual-level factors that could be associated with these two outcomes. We first accounted for prior criminal history based on the number of felonies, misdemeanors, and status offenses for each juvenile from 2018 to 2022. Delinquent acts were labeled as felonies or misdemeanors depending on whether the act would be considered a felony or misdemeanor under adult criminal law. Furthermore, we accounted for five status offenses recognized by Missouri law in the analyses, which include (1) truancy, (2) incorrigible child, (3) runaway child, (4) behavior or associations injurious to the welfare of the child, and

(5) the child is charged with an offense not classified as criminal or applicable only to the child.

The models also account for demographic characteristics that could be associated with the two juvenile outcomes. For instance, we include variables that capture the defendant's age, gender, and race/ethnicity in the models. To isolate the race/ethnicity of the juvenile, four binary variables were created (Black, Hispanic, Asian and Pacific Islander, and American Indian and Alaskan Native) with white defendants serving as the comparison group. In other words, the results for the four binary variables are interpreted in terms of their relationship to the white reference category.

We also account for the risks and needs of each juvenile defendant in the models. All the information collected in Missouri regarding risks and needs can be found in Appendix A. A few examples of the risks and needs examined in the dataset includes age at first referral, number of prior referrals, number of assault referrals, history of placement, history of child abuse or neglect, peer relationships, parental incarceration, mental illness, substance abuse, and presence of a positive social support system.

The results from the logistic regression models with robust standard errors that examined whether a juvenile is detained are presented in Table A3 in Appendix A. To determine whether a defendant's race/ethnicity is a significant predictor of detention, we entered all the previously discussed individual- and case-level variables in the model at the same time. Since this model accounts for a wide range of factors that could be associated with sentencing outcomes, the rigor associated with these analyses will give us greater confidence when determining the role that a defendant's race/ethnicity plays in shaping sentencing decisions.

The findings in Table A3 show that Black juveniles were significantly more likely to be detained in comparison to white youth. This result is particularly important because it holds even when accounting for defendant's prior criminal history, their demographic characteristics, and their risks and needs. The findings in this table also show that there are no significant differences in the likelihood of detention among Hispanic, Asian, American Indian, and white juveniles.

Factors Associated with Longer Lengths of Detention Among Juveniles

The results that examine if a defendant's race/ethnicity is associated with the length of their detention are presented in Table A4 in Appendix A. Since the length of stay is recorded in terms of the number of days, we examine this research question using a zero-truncated negative binomial regression model with robust standard errors since it is not possible for a detained juvenile to report zero days detained.

Similar to the previous results, the findings in Table A4 show that Black juveniles in Missouri receive significantly longer detention stays in comparison to white defendants. Again, this result is particularly important because this relationship is maintained when accounting for the defendant's prior criminal history, their demographic characteristics, and their risks and needs. Additionally, we found that there were no significant differences between Hispanic, Asian, American Indian, and white juveniles in terms of their length of detention.

Summary of Juvenile Record Findings

Overall, the examination of the juvenile records revealed significant Black disparities across most jurisdictions and the entire state of Missouri. We also found that there was considerable variation in terms of the magnitude of the Black disparities across the outcomes and jurisdictions. While these disparities could possibly be evidence of racial bias in Missouri Courts, they could also be attributed to other factors, including law enforcement practices and/or broader societal issues.

While the previous results indicate substantial disparities for Black defendants across the various outcomes, one of the limitations associated with these analyses is that we cannot account for additional individual- and case-level factors that could be associated with the four outcomes. Based on this limitation, we performed additional analyses that accounted for a wide range of individual- and case-level factors that could potentially shape juvenile outcomes. The results from these analyses indicated that Black juveniles were significantly more likely to be detained and for longer periods of time in comparison to white defendants.

Based on the results from the multivariate analyses, we can conclude that race plays a role in juvenile processing in Missouri.

TREATMENT COURT RECORDS RESULTS

In this section of the report, we examine whether a defendant's race/ethnicity is associated with treatment court graduations and terminations. As previously stated, the dataset used in these analyses contains 12,293 cases across adult drug court, DWI court, veteran court, family court, and juvenile drug court from 2018 to 2022.

Similar to the juvenile records, the treatment court files included more detailed information about each defendant, which allows for a more direct examination of whether a defendant's race/ethnicity is related to their treatment court outcomes. For example, the treatment court records contained a wide range of individual-level information, such as the defendant's age, race, ethnicity, gender, employment status, level of education, living situation, criminal record, and substance use. The dataset also contains information related to whether the defendant experienced behavioral issues in childhood, as well as the offender's risks and needs. A full list of the individual-level characteristics that are accounted for in the models is included in Tables B1, B2, and B3 in Appendix B.

We examined the following two research questions using the information contained within the treatment court dataset:

1. Is the race/ethnicity of the defendant a significant predictor of program graduation when controlling for additional individual- and case-level information?
2. Is the race/ethnicity of the defendant a significant predictor of administrative termination when controlling for additional individual- and case-level information?

Program Graduation

To address the first research question, we performed a logistic regression analysis with robust standard errors that examined whether a defendant's race/ethnicity is a significant predictor of program graduation. In order to determine whether race/ethnicity is associated with this outcome, three binary variables were created (Black, Hispanic, and Asian and Pacific Islander), with white defendants serving as the comparison group. In other words, the results for the three binary variables are interpreted in terms of their relationship to the white reference category.

The results that examine the program graduation dependent variable are included in Table B4 in Appendix B. These findings indicate that Black treatment court participants were significantly less likely to graduate from a treatment program in comparison to white participants, even when accounting for criminal history, substance abuse level, employment, age, and all other risks and needs. The results in this table also show that there were no significant differences between Hispanic, Asian, and white defendants in terms of whether they graduated from their treatment program.

Administrative Termination

A similar approach is used to examine whether a defendant's race/ethnicity is associated with administrative terminations. More specifically, we examine this question by including the three race/ethnicity binary variables in the models with the previously discussed individual- and case-level variables.

The findings that examine the correlates of administrative terminations are included in Table B5 in Appendix B. Consistent with the previous results, we found that Black treatment court participants were significantly more likely to receive an administrative termination in comparison to white defendants. The findings also show that there are no significant differences between Hispanic, Asian, and white defendants in terms of the likelihood of receiving an administrative termination.

Summary of Treatment Court Record Results

Similar to the juvenile dataset, the extensive individual- and case-level information contained within the treatment court records allowed for a more in-depth analysis of whether defendants' race/ethnicity was associated with treatment court outcomes. The results from these analyses indicated that Black treatment court participants were significantly less likely to graduate in comparison to white defendants. Additionally, we found that Black participants were also more likely to receive an administrative termination in comparison to white defendants. Finally, we did not detect any significant differences between Hispanic, Asian, and white defendants in terms of treatment court graduation or termination. Based on the results from these analyses, we can conclude that race plays a role in treatment court outcomes in Missouri for Black participants.

HOMICIDE RECORDS RESULTS

This section provides a detailed examination of whether a defendant's race/ethnicity is significantly associated with the outcome in homicide cases. More specifically, this section seeks to address the following four research questions:

1. Is the race/ethnicity of the defendant significantly associated with being convicted in Missouri homicide cases?
2. Is the race/ethnicity of the defendant significantly associated with having one's case dismissed in Missouri homicide cases?
3. Is the race/ethnicity of the defendant significantly associated with longer prison sentences in Missouri homicide cases (not including life in prison sentences or death penalty)?
4. Is the race/ethnicity of the defendant significantly associated with receiving life in prison or the death penalty in Missouri homicide cases?

Convictions and Dismissals

The data used in the analyses were derived from the adult criminal court dataset that contains 13 million charges. Between 2010 and 2022, there were 7,261 individuals charged with first degree homicide, second degree homicide, and voluntary manslaughter across all jurisdictions in Missouri. Additionally, we only included cases with a favorable (i.e., dismissed or not guilty) or unfavorable (guilty or Alford plea) outcome. Similar to the previous juvenile and treatment analyses, we examine whether a defendant's race/ethnicity is significantly related to these two homicide outcomes while controlling for additional factors in the models.

First, we included several individual- and case-level variables in the model. For example, the age and race of the defendant, whether the defendant used a public defender, and the number of co-defendants were all accounted for in the analyses. Second, we included several jurisdictional-level predictors that prior research has indicated are important contextual factors associated with aggregate sentencing outcomes. Appendix C contains a list of the jurisdictional-level contextual variables that are included in the analyses.

When considering all three types of homicide charges, the records indicate that 4,760 (~65 percent) defendants were convicted, while 1,985 individuals (~28 percent) had their cases dismissed by either a prosecutor (1,748) or the court (237). In terms of the race/ethnicity of the defendants, Black defendants made up the

highest percentage of individuals charged with homicide at 55 percent (3,962 individuals), while whites made up 43 percent (3,131), Hispanics made up 2 percent (131) and Asians made up .5 percent (43).

The results that examine whether a defendant's race/ethnicity is associated with a conviction are contained in Table C1 in Appendix C. The results from the logistic regression models with cluster robust standard errors show that Asian homicide defendants were significantly more likely to be convicted in comparison to white defendants. The findings also indicate that there were no significant differences in terms of whether the defendant was convicted based on the remaining races/ethnicities. Furthermore, the results show that defendants that relied on a public defender and older defendants were significantly more likely to be convicted. We also found that defendants charged with second degree homicide and voluntary manslaughter were significantly more likely to have their case end in a conviction. In addition to the individual- and case-level results, we found that defendants living in jurisdictions with a greater percentage of Hispanic residents were significantly more likely to be convicted of a homicide. It is important to note that the previous result applies to all defendants in jurisdictions where there is a greater percentage of Hispanic residents. According to the racial/ethnic threat perspective, when the racial/ethnic majority uses punitive punishments to control the behavior of minorities, there is the potential for members of the majority group to be negatively impacted by these punishments as well.

We see very similar results when looking at the dismissal dependent variable, which are contained in Table C2 in Appendix C. The results from the logistic regression model indicate that Asian defendants were significantly less likely to have their case dismissed in comparison to white defendants. We also found that defendants who relied on a public defender and those charged with second degree homicide and voluntary manslaughter were significantly less likely to have their case dismissed. In terms of the contextual predictors, we found that defendants who lived in more populated jurisdictions were significantly more likely to have their cases dismissed.

Sentencing

The results when examining the relationship between a defendant's race/ethnicity and the length of their sentence are contained in Table C3 in Appendix C. The results from the zero-truncated negative binomial regression model with cluster robust standard errors indicate that there were no significant differences across races/ethnicities in terms of sentence length (not including life in prison or death

sentences). We also found that older defendants, those with more co-defendants, and those charged with first-degree homicide were all significantly more likely to receive a longer prison sentence.

Finally, the results when examining whether a defendant's race/ethnicity is associated with the imposition of a death sentence or life in prison are presented in Table C4 in Appendix C. As noted previously, since life in prison and a death sentence share the same coding in the adult criminal dataset, we examined both outcomes at the same time. The results from the logistic regression models with cluster robust standard errors show Hispanic defendants were significantly more likely to receive a sentence of death or life in prison in comparison to white defendants. Interestingly, the findings also show that Black defendants were significantly less likely to receive a sentence of life in prison or death in comparison to white defendants. The findings also show that older defendants and those charged with a first-degree homicide were significantly more likely to receive a death sentence or life in prison.

Summary of Homicide Record Analysis

The results from these analyses indicate that a defendant's race/ethnicity is associated with several of the homicide outcomes. For example, we found that Asians were significantly more likely to be convicted and significantly less likely to have their cases dismissed in comparison to white defendants. We also found that Hispanic defendants were significantly more likely to receive life in prison or a death sentence in comparison to white defendants, while Black defendants were significantly less likely to receive these sentences in comparison to white defendants. However, no racial/ethnic differences were detected when examining the length of the homicide sentence, when life in prison sentences and death penalty impositions were not included.

Overall, the results from these analyses suggest that the sentences handed down to homicide defendants could be shaped by racial/ethnic bias. While we were able to account for a few additional factors in the homicide analyses, it is important to note that we would need more individual- and case-level information before we could conclude with certainty that the sentencing outcomes were the direct result of racial/ethnic bias. Based on this limitation, caution should be exercised when interpreting these results.

JUDICIAL PROCESSING RECORD RESULTS

We found widespread racial disparities in adult criminal convictions across most of the 33 jurisdictions and crime types that we examined in the first phase of the study. However, due to limitations in the adult criminal court records, we could not determine the source of the racial disparities or the role that the court system played in producing these disparities. To partially address the limitations in Phase I of the study, we obtained a new adult criminal court dataset that was not limited to cases that ended in conviction.

The most recent version of the adult criminal court dataset contains 13,886,738 adult criminal records from 2010 to 2022. One of the primary advantages associated with examining all criminal cases regardless of the outcome is that we can begin to isolate the role that the court system plays in producing the disparities that were reported in Phase I. More specifically, the new adult criminal court records will allow us to examine racial disparities at multiple phases of the criminal justice process—from arrest, to charging decisions, to convictions—to examine whether the racial disparities changed throughout this process. If racial disparities increased when moving through the judicial process, this could be an indication of possible racial/ethnic discrimination in the courts. However, if the racial disparities largely remain the same when moving through the court process, then this would suggest that the courts are processing defendants in proportion to how they are received from law enforcement.

In addition to examining disparities from arrest to conviction/dismissal across the original 33 jurisdictions, this section reexamines the pre- and post-Ferguson analyses using the new adult criminal court records. Similar to the rationale behind the previous analyses, we attempt to determine the role that the courts played in shaping the results across the pre- and post-Ferguson time periods.

This section of the report seeks to address the following questions:

1. How do the racial disparities reported in Phase I of the study change when moving across the criminal justice process?
2. How do the pre- and post-Ferguson racial disparities documented in Phase I change when moving across the criminal justice process?

Selecting the Jurisdictions

Due to the large size of the official records database, we determined that it would not be possible to provide a detailed examination of all jurisdictions in Missouri during the first phase of the report. Instead, the research team, in collaboration with the Missouri Commission on Racial and Ethnic Fairness, identified 33 jurisdictions for an in-depth examination of the presence of racial disparities across several types of charges and sentencing outcomes. The jurisdictions were chosen using two methods.

The first method that was used to select jurisdictions for inclusion in the Phase I report involved choosing jurisdictions based on the size of the Black population. To calculate demographic information for each jurisdiction, we averaged the results from the American Community Survey's (ACS) five-year estimates for 2010 to 2014 and 2015 to 2019 (see Appendix D). The demographic information for each jurisdiction that was used in this report ends in 2019 because records for later years were not available when the research team began analyzing the official records.

Furthermore, it is important to note that the demographic information for each jurisdiction was calculated using the racial/ethnic categories that were contained in the official records database. In other words, since the official dataset did not include categories for biracial defendants, we dropped these categories when calculating the racial/ethnic percentages for each jurisdiction using the ACS information. Based on a request from the Missouri Commission on Racial and Ethnic Fairness, we included all 23 jurisdictions that reported a Black population larger than 5.0%.

The second method that was used to select jurisdictions involved the random selection of 10 counties that reported a Black population between 1.0% and 5.0%. The research team included these additional counties since it is possible that racial disparities in sentencing could be just as pronounced, if not larger, in jurisdictions where Blacks comprise a relatively small segment of the population. Figure 1 shows a map of the jurisdictions used in this report, while Table 5 presents the 33 selected jurisdictions and the percentage of Black population for each jurisdiction.

Figure 1: Shaded jurisdictions were included in our analysis of racial disparities.

Table 5: List of All Selected Jurisdiction by the Percentage of Black Residents*		
St. Louis City (48.3%)	Boone County (9.2%)	Buchanan County (5.1%)
Pemiscot County (27.5%)	Cape Girardeau County (7.5%)	Johnson County (4.5%)
Mississippi County (24.5%)	Pike County (6.6%)	Cass County (3.9%)
St. Louis County (24.2%)	Platte County (6.6%)	Greene County (3.2%)
Jackson County (24.1%)	Audrain County (6.0%)	Macon County (2.4%)
New Madrid County (16.0%)	Cooper County (5.9%)	Lafayette County (2.2%)
Cole County (11.8%)	Randolph County (5.9%)	Sullivan County (1.6%)
Scott County (11.6%)	Clay County (5.8%)	McDonald County (1.6%)
Pulaski County (11.2%)	Butler County (5.5%)	Warren County (2.0%)
Dunklin County (10.5%)	Howard County (5.5%)	Ste. Genevieve County (1.2%)
DeKalb County (10.2%)	Saline County (5.2%)	Webster County (1.1%)

*The percentage of Blacks within jurisdictional populations was calculated using the American Community Survey five-year estimates for 2010 to 2014 and 2015 to 2019.

Selection of Charge Types

After selecting the jurisdictions in the first phase of the report, the research team then turned to the selection of specific charges to examine in these jurisdictions. The research team wanted to ensure that there were enough offenders across the selected jurisdictions so that the statistics for the sentencing outcomes were not based on a very small number of defendants. To achieve this goal, we first examined the frequency in which defendants were sentenced for all crimes across the study period.

After determining which crimes occurred with the highest frequency across the state, the research team then consulted Missouri Charge Code manuals for the period from 2010 to 2021. In addition to ensuring that the sentencing outcomes examined in this report are not based on a small number of offenders, it was also important to determine whether specific crimes underwent significant alterations across the various iterations of the charge code manuals.

Based on our review of the changes in charge codes across the study period, the research team selected the following charge types and specific crimes:

- All charges
- All felonies
- All misdemeanors
- Possession of a controlled substance
- Armed Criminal Action
- Burglary (2nd degree)
- Domestic Violence (2nd degree)
- Driving While Intoxicated (DWI)

These specific crimes were selected because they both occurred at the highest frequency across the state and the charge codes for these offenses were directly comparable over the study period.

As previously noted, we heard that Hispanics were often coded as white in the official records database. Additionally, the percentages for Asian and Pacific Islander and American Indians & Alaskan Natives are frequently based on only a handful of offenders across the various jurisdictions. Based on these considerations, we primarily focused on Black racial disparities for the various charge types and outcomes in Phase I and II of the report.

Analysis Method

Using the same outcomes and jurisdictions identified in Phase I of this project, we seek to examine how racial disparities changed throughout the criminal justice process in Phase II. To address this question, we first determined racial/ethnic information for all defendants for the charges and crimes that were previously noted. This information will provide us with the racial breakdown of all defendants that law enforcement provided to the courts.

Next, we separated this information into two sentencing outcomes—favorable and unfavorable outcomes. Favorable outcomes included prosecutor dismissal, court dismissal, and not a guilty verdict. Unfavorable outcomes end in a conviction, which can include a guilty verdict, guilty plea, Alford plea, or default judgment. We then calculated the percentage of Black individuals with favorable outcomes and unfavorable outcomes for each charge type and crime.

Generally speaking, if the courts are simply taking in individuals as law enforcement officials had referred without disparate treatment regarding race/ethnicity, then we would likely see the percentages stay the same from the arrest to the favorable or unfavorable outcome. If there was some racially disparate treatment once the individual reached the courts, we would expect to see unfavorable percentage increase in Black individuals, while favorable percentages would decrease.

Results of Analysis

Using the same 33 jurisdictions from Phase I, we found that the racial disparities largely remained the same throughout the criminal justice process, indicating that courts are largely processing the already disparate cases they received. However, there were some increases in racial disparities, particularly with respect to armed criminal action charges, in several jurisdictions and the entire state. (See Tables 6 and 7 for the full results of these analyses. See Appendix E for the specific tables for each county.)

The results in Table 6 show the change in percentage of arrests of Black individuals for each charge type vs. percentage of Black individuals who had favorable

**The average percent for all sentencing outcomes does not include statistics for Missouri in the calculations.

† This symbol indicated that the disparity percent was calculated based on less than 10 Black defendants.

outcomes. In counties where there is a plus sign, Black individuals had more favorable outcomes than their arrest percentages for that specific charge type. In counties where there is a negative sign, Black individuals had less favorable outcomes than their arrest percentages for that specific charge type.

The results in Table 7 show the difference in the percentage of arrests of Black individuals for each charge type and the percentage of Black individuals who had unfavorable outcomes. The findings show that the change scores remained relatively stable across all jurisdictions and most of the charge types. The only possible exception is armed criminal action where we see unfavorable percentages increase in many jurisdictions. For example, in the entire state of Missouri, the percentage of Black individuals charged with armed criminal action increased by over 14 percent, which could indicate some racially disparate treatment.

Overall, the results from these analyses show that the racial disparities we found in Phase I are due to either law enforcement or larger societal issues.

Racial Disparities for Select Sentencing Outcomes Pre- and Post-Ferguson

Similar to the approach adopted in the first report, the research team used the adult criminal court database to determine whether the percentage of Black defendants changed after the City of Ferguson and the United States Department of Justice entered into a consent decree in 2016. To examine this question, we calculated the percentage of Black defendants for each of the charge types and sentencing outcomes for a select number of jurisdictions from 2010 to 2015 (pre-Ferguson) and 2016 to 2022 (post-Ferguson). The following five jurisdictions were selected based on their proximity to the City of Ferguson: Franklin County, Jefferson County, St. Charles County, St. Louis City, and St. Louis County. Furthermore, the research team also examined change scores for Blacks in Boone County, Greene County, and Jackson County based on both the overall size of these jurisdictions' populations and the size of their Black populations.

We examine jurisdictional changes in the percentage of Black defendants using three sets of analyses. The first set of analyses examines the change in the percentage of all Black defendants across the eight outcomes. The second set of analyses examines the change in the percentage of Black defendants when only considering sentencing outcomes that were favorable to the defendant. Finally, the last set of analyses examines the change in the percentage of Black defendants

when strictly focusing on cases that resulted in an unfavorable sentencing outcome for the defendant.

Table 8 contains the results from the first set of analyses that examine the change in the percentage of all Black defendants across the two time periods. A negative change score in this table indicates that there was a decrease in the percentage of Black defendants across the two time periods, while a positive change score shows an increase in the percentage of Black defendants from the pre- to the post-Ferguson time period. The tables containing the original percentage breakdown for whites and Blacks across the selected jurisdictions and sentencing outcomes are presented within Appendix E.

The results in Table 8 indicate that the change in the percentage of Black defendants varied based on the jurisdiction and outcome. For instance, the findings in this table show that there was a negative change score for almost every sentencing outcome for the entire state of Missouri. The only instance at the state level where the percentage of Black defendants increased across the two time periods was in terms of DWIs. These results indicate that the overall percentage of Black defendants across the state declined for nearly all the outcomes when moving from the pre- to the post-Ferguson time period.

The findings in Table 8 also show that there is considerable variation in the change scores among the jurisdictions that are located near the City of Ferguson. For example, this table shows that there was a negative change score for at least five of the eight (62.5%) outcomes for St. Louis City and St. Louis County. However, this table also shows that negative change scores occurred far less frequently in Franklin (37.5%), St. Charles (12.5%), and Jefferson (0.0%) Counties.

The results in Table 8 also show variation in the change scores for the three counties that were not located near the City of Ferguson. The information in this table shows that Jackson County reported a decrease in the percentage of Black defendants across seven of the eight (87.5%) outcomes after 2016. Furthermore, the results in this table show that there was a negative change score for Black defendants across 50.0% of the outcomes in Boone County and 12.5% of the outcomes in Greene County.

In addition to examining change scores for all Black defendants, the research team investigated change scores based on whether the outcome of the case was favorable or unfavorable to the defendant. Table 9 presents the change scores for Black defendants when strictly considering cases that resulted in a favorable

outcome for the defendant. A positive change score in these analyses indicates that there was an increase in the percentage of Black defendants who obtained a favorable outcome across the two time periods.

The results in Table 9 show that every jurisdiction reported a positive change score for at least half of the eight outcomes. For instance, we see that Franklin County, St. Louis City, and St. Louis County reported an increase in favorable decisions for Black defendants across 87.5% of the sentencing outcomes, followed by Greene County (75.0%), Jefferson County (75.0%), the state of Missouri (62.5%), Boone County (62.5%), St. Charles County (62.5%), and Jackson County (50.0%).

Lastly, Table 10 contains the change in the percentage of Black defendants who received unfavorable outcomes across the two time periods. Similar to the results for all defendants, we see considerable jurisdictional variation in the change scores for the eight outcomes. A negative change score in this set of analyses indicates that there was a decrease in the percentage of Black defendants who received unfavorable outcomes across the two time periods. The results indicate that Jackson County (100.0%), St. Louis City (87.5%), the state of Missouri (87.5%), and St. Louis County (75.0%) reported the highest number of negative change scores across the eight outcomes. The findings also show that negative change scores occurred less frequently in Franklin County (50.0%), Boone County (37.5%), St. Charles County (25.0%), Greene County (12.5%), and Jefferson County (12.5%).

While these results indicate that the occurrence of negative change scores varied considerably across jurisdiction and outcome, it is important to note that we were only able to examine a small number of jurisdictions in these analyses. Furthermore, the small number of criminal offenses examined across the two time periods is also a limitation associated with these analyses. Therefore, it is currently unclear whether we would continue to see these patterns if we selected different jurisdictions or criminal offenses. Based on these limitations, we continue to recommend that these results be taken with caution until the research team performs more extensive analyses that include additional counties from across the state and a wider variety of criminal offenses.

Summary of Adult Criminal Records Results

In Phase I, we found widespread racial disparities in adult criminal convictions for almost all crime types and across most of the 33 jurisdictions we studied. However, we could not determine the cause of the racial disparities.

In Phase II, using 13,886,738 adult criminal records from 2010 to 2022 that also included arrests, we examined racial disparities at multiple phases of the criminal justice process—from arrest, to charging decisions, to convictions—to examine whether the racial disparities changed throughout that process.

Overall, our examination of adult criminal records that included non-convictions largely showed that courts are processing cases in the manner they are received from law enforcement, which indicates that the racial disparities in the Missouri criminal justice system originate with law enforcement or society at large. However, the specific charge of armed criminal action did show increasing racial disparities in most jurisdictions included in the study.

Additionally, we examined records before and after the Ferguson incident in 2014, which brought a national spotlight to racial/ethnic issues in the Missouri criminal justice system. The results from these analyses were mixed, with some jurisdictions racial disparities increased after Ferguson, while some decreased.

RECOMMENDATIONS & FUTURE RESEARCH

Based on the Phase I and II results as a whole, there are some improvements that can be made to continue to investigate and increase justice and fairness in the Missouri court system. In Phase I we provided a comprehensive and detailed list of 15 overall recommendations. We would like to stress and reiterate those recommendations in Phase II, with the addition of the first three recommendations as outlined below.

1. **Evaluate juvenile detention policies.** We recommend a full evaluation of juvenile detention policies statewide to ensure that detention and length of detention is determined in a fair and objective manner.
2. **Evaluate treatment court policies.** We recommend a full evaluation of treatment court policies statewide to ensure that all treatment court participants have equal support to complete treatment court programs.
3. **Take a more holistic approach to improving fairness and justice in the Missouri criminal justice system.** While the magnitude of racial disparities found in Missouri criminal convictions was problematic in Phase I, Phase II showed that it is not the court alone who can address these racial disparities. We recommend that a statewide commission is created that represents law enforcement, community leaders, corrections officials, researchers, and court officials to address these issues on a more comprehensive, holistic level.

Below is a summary of our recommendations from Phase I.

4. **Collect additional data.** To fully examine racial bias in official state records, we need more data. Ideally, datasets will include all variables that are used in making sentencing decisions. If we have these variables, we are better able to isolate race and determine if it is, in itself, a factor in prosecutorial, judicial, and jury decision-making. This information should include:
 - a. Defendant criminal history
 - b. Severity of crime
 - c. Weapon(s) used
 - d. Victim characteristics
 - e. Death sentences
 - f. Any mitigating factors
 - g. Any aggravating factors

5. **Ensure the collection of accurate racial data.** The strength of the statistical analyses by researchers are only as strong as the available data. We encourage the state to increase the accuracy of racial data in all jurisdictions, including civil cases.
6. **Collect and report all pre-trial data.** This information should also include racial demographics and all phases of the pre-trial processes. More specifically, we recommend the collection of the following pieces of information:
 - a. Bail decisions
 - b. Pre-Trial Detention
 - c. Charging Decisions, including charge reductions and armed criminal action
 - d. Cases dismissed
7. **Have regular independent reviews of state court records.** Part of the process associated with collecting court data should include examining and analyzing the data on a regular basis. Cooperating with independent researchers will likely yield stronger research designs, analyses, and conclusions.
8. **Make these reports regularly available to the public to increase transparency and accountability in the court system.** In addition to examining the official records on a regular basis, we also recommend making the reports generated using these records available to the public.
9. **Provide a safe and secure mechanism for racial and ethnic bias incident reporting.** In Phase I of our study, some participants who witnessed or experienced racial bias or discrimination did not know how to report incidents and/or did not feel comfortable reporting these incidents.
10. **Make sure people who report incidents feel heard.** In Phase I, we heard from a number of respondents that they did not believe that court officials were concerned with their experiences with discrimination in the workplace.
11. **Make interpreters available statewide.** To increase fairness, the state should ensure that interpreters are available in all jurisdictions.
12. **Increase procedural justice in the courts.** Procedural justice training for everyone who directly interacts with defendants and litigants can increase respect and fairness in Missouri courts, as well as potentially create more positive court outcomes and have a better overall relationship with the community.
13. **Make regular diversity and bias training mandatory for all people working in the courts.** In order to ensure that all court employees who interact with the public have received diversity and/or bias training, we recommend that all court actors should receive regular mandatory training.

14. **Consider diversity and bias training for jurors.**
15. **Make diversity and bias training more engaging, in-person, and interactive.** We recommend that the Missouri Court system consider requiring a live speaker as a mandatory aspect of diversity and/or bias training to make the training more interesting and dynamic.
16. **Create an ongoing education system that focuses on the consequences that incarceration has on individuals, families, and communities.** A wide body of literature outside of the court system has documented the effect that a criminal record and being incarcerated has on defendants, their families, and the broader community. All courtroom decision-makers should receive regular scholarly updated education on the consequences associated with exercising their decision-making responsibilities.
17. **Utilize alternatives to incarceration wherever possible.** To mitigate the effects of possible systemic bias on people of color, alternatives to incarceration should be used wherever possible, which include treatment courts, restorative justice programs, and probation.
18. **Continue partnering with independent researchers to examine issues of racial and ethnic bias in Missouri courts.** Issues regarding fairness in the criminal justice system are always ongoing as new data continually emerges. Additionally, any progress associated with implementing new initiatives to address these issues in the court system should be monitored and evaluated by independent researchers.

CONCLUSION

As documented in Phase I, examining statewide racial disparities and racial/ethnic bias is a large undertaking. Therefore, a full examination of this complex question must occur in phases.

Phase II of our study shed more light on issues regarding racial and ethnic fairness in the Missouri court system. We found Black juveniles were associated with higher detention and longer lengths of stay in comparison to white juveniles, even when taking other factors into consideration. We also found Black treatment court participants were associated with lower graduation and higher administrative termination in comparison to white participants. Additionally, we found further issues in homicide convictions.

We also found racial disparities in favorable and unfavorable court outcomes did not significantly change from arrest to final court outcome, suggesting that much of the racial disparities we found in Phase I started at the arrest stage. This suggests that the disparities can be attributed to law enforcement practices and/or larger societal issues.

We welcome the opportunity to continue this research and help the Missouri Court system gain insight on these important issues.

We commend the Commission on Racial and Ethnic Fairness (CREF) and the Supreme Court of Missouri for striving to increase fairness and justice for all.

APPENDIX A

Table A1: Risk Questions for Juveniles Referred to Missouri Courts

Risk	Description	Answer Options
Risk 1	Age at first referral	<ul style="list-style-type: none"> ○ 12 and under ○ 13 ○ 14 ○ 15 ○ 16 ○ Unknown
Risk 2	Prior Referrals	<ul style="list-style-type: none"> ○ None ○ One or more ○ Unknown
Risk 3	Assault Referrals	<ul style="list-style-type: none"> ○ No prior or present referrals for assault ○ One or more prior or present referrals for misdemeanor assault ○ One or more prior or present referrals for felony assault ○ Unknown
Risk 4	History of Placement	<ul style="list-style-type: none"> ○ No prior out-of-home placement ○ Prior out-of-home placement ○ Unknown
Risk 5	Peer Relationships	<ul style="list-style-type: none"> ○ Neutral Influence ○ Negative Influence ○ Strong Negative Influence ○ Unknown
Risk 6	History of Child Abuse/Neglect	<ul style="list-style-type: none"> ○ History of child abuse/neglect ○ No history of child abuse/neglect ○ Unknown
Risk 7	Substance Abuse	<ul style="list-style-type: none"> ○ No alcohol or drug abuse problem is apparent ○ Moderate alcohol and/or drug abuse problem ○ Severe alcohol and/or drug abuse/dependence ○ Unknown
Risk 8	School Attendance/Disciplinary	<ul style="list-style-type: none"> ○ No or only minor problems ○ Moderate problems ○ Severe problems ○ Unknown

Risk 9	Parental Management Style	<ul style="list-style-type: none"> ○ Effective management style ○ Moderately ineffective management style ○ Severely ineffective management style ○ Unknown
Risk 10	Parental History of Incarceration	<ul style="list-style-type: none"> ○ No prior incarceration ○ Prior incarceration ○ Unknown
Risk level	Overall risk level	<ul style="list-style-type: none"> ○ Low ○ Moderate ○ High

Table A2: Needs Questions for Juveniles Referred to Missouri Courts

Risk	Description	Answer Options
Need 1	Behavior Problems	<ul style="list-style-type: none"> ○ No significant behavior problem ○ Moderate behavior problem ○ Severe behavior problem ○ Unknown
Need 2	Attitude	<ul style="list-style-type: none"> ○ Motivated to change/accepts responsibility ○ Generally uncooperative, defensive, not motivated to change ○ Very negative attitude, defiant, and resistant to change ○ Unknown
Need 3	Interpersonal Skills	<ul style="list-style-type: none"> ○ Good interpersonal skills ○ Moderately impaired interpersonal skills ○ Severely impaired interpersonal skills ○ Unknown
Need 4	Peer Relationships	<ul style="list-style-type: none"> ○ Neutral influence ○ Negative influence ○ Strong negative influence ○ Unknown
Need 5	History of Child Abuse/Neglect	<ul style="list-style-type: none"> ○ No history of child abuse/neglect ○ History of child abuse/neglect ○ Unknown
Need 6	Mental Health	<ul style="list-style-type: none"> ○ No mental health disorder ○ Mental health disorder with treatment ○ Mental health disorder with no treatment ○ Unknown
Need 7	Substance Abuse	<ul style="list-style-type: none"> ○ No alcohol or drug abuse problem is apparent ○ Moderate alcohol and/or drug abuse problem ○ Severe alcohol and/or drug abuse/dependence ○ Unknown

Need 8	School Attendance/Disciplinary	<ul style="list-style-type: none"> ○ No or only minor problems ○ Moderate problems ○ Severe problems ○ Unknown
Need 9	Academic Performance	<ul style="list-style-type: none"> ○ Passing without difficulty ○ Functioning below average ○ Failing ○ Unknown
Need 10	Learning Disorder	<ul style="list-style-type: none"> ○ No diagnosed learning disorder ○ Diagnosed learning disorder ○ Unknown
Need 11	Employment	<ul style="list-style-type: none"> ○ Not applicable ○ Unemployed ○ Part-time employment ○ Full-time employment ○ Unknown
Need 12	Juvenile Parental Responsibility	<ul style="list-style-type: none"> ○ No children ○ One child ○ Two children ○ Three or more children ○ Unknown
Need 13	Health/Handicaps	<ul style="list-style-type: none"> ○ No health problems or physical handicaps ○ Pregnancy ○ No problems, but limited access to health care ○ Mild physical handicap or medical condition ○ Serious physical handicap or medical condition ○ Unknown
Need 14	Parental Management Style	<ul style="list-style-type: none"> ○ Effective management style ○ Moderately ineffective management style ○ Severely ineffective management style ○ Unknown
Need 15	Parental Mental Health	<ul style="list-style-type: none"> ○ No parental history of mental health disorder ○ Parental history of mental health disorder ○ Unknown

Need 16	Parental Substance Abuse	<ul style="list-style-type: none"> ○ No parental substance abuse ○ Parental substance abuse ○ Unknown
Need 17	Social Support System	<ul style="list-style-type: none"> ○ Strong support system ○ Limited support system with one positive role model ○ Weak support system, no positive role models ○ Strong negative or criminal influence ○ Unknown

APPENDIX B

Table B1: APD Questions for Treatment Court Participants

APD	Question	Answer Options
APD1	Before you were 15, would you bully or threaten other people?	<input type="radio"/> No <input type="radio"/> Yes
APD2	Before you were 15, would you start fights?	<input type="radio"/> No <input type="radio"/> Yes
APD3	Before you were 15, did you hurt or threaten someone with a weapon like a bat, brick, broken bottle, knife or gun?	<input type="radio"/> No <input type="radio"/> Yes
APD4	Before you were 15, were you deliberately cruel to someone or cause someone physical pain or suffering?	<input type="radio"/> No <input type="radio"/> Yes
APD5	Before you were 15, did you torture or hurt animals on purpose?	<input type="radio"/> No <input type="radio"/> Yes
APD6	Before you were 15, did you mug, rob, or forcibly take something from someone by threatening him or her?	<input type="radio"/> No <input type="radio"/> Yes
APD7	Before you were 15, did you force someone to get undressed or have sexual contact with you?	<input type="radio"/> No <input type="radio"/> Yes
APD8	Before you were 15, did you set fires?	<input type="radio"/> No <input type="radio"/> Yes
APD9	Before you were 15, did you deliberately destroy things that weren't yours?	<input type="radio"/> No <input type="radio"/> Yes
APD10	Before you were 15, did you break into houses, other buildings, or cars?	<input type="radio"/> No <input type="radio"/> Yes
APD11	Before you were 15, did you lie a lot to get things from other people or to get out of trouble?	<input type="radio"/> No <input type="radio"/> Yes
APD12	Before you were 15, did you steal, shoplift or forge someone's signature?	<input type="radio"/> No <input type="radio"/> Yes
APD13	Before you were 15, did you run away from home and stay out overnight more than once? (Or once for an extended period of time)	<input type="radio"/> No <input type="radio"/> Yes
APD14	Before you were 13, did you often stay out very late, long after the time you were supposed to be home?	<input type="radio"/> No <input type="radio"/> Yes
APD15	Before you were 13, did you often skip school?	<input type="radio"/> No <input type="radio"/> Yes

APD16	Have you done things that are against the law - even if you weren't caught - like stealing, shoplifting, selling drugs, or writing bad checks?	<input type="radio"/> No <input type="radio"/> Yes
APD17	Do you often lie, use false names, or con other people to get what you want?	<input type="radio"/> No <input type="radio"/> Yes
APD18	Do you often do things on the spur of the moment without thinking about how they will affect you or other people?	<input type="radio"/> No <input type="radio"/> Yes
APD19A	Since you were 15 years old, have you been in more than one fight?	<input type="radio"/> No <input type="radio"/> Yes
APD19B	Have you hit or thrown something at your spouse or partner?	<input type="radio"/> No <input type="radio"/> Yes
APD19C	Since you were 15 years old, have you hit a child so hard that he or she had cuts or bruises, had to stay in bed, or had to see a doctor?	<input type="radio"/> No <input type="radio"/> Yes
APD19D	Since you were 15 years old, have you physically threatened or hurt anyone else?	<input type="radio"/> No <input type="radio"/> Yes
APD20A	Did you ever drive a car when you were high or drunk?	<input type="radio"/>
APD20B	Have you received three or more tickets for speeding, moving violations or reckless driving?	<input type="radio"/> No <input type="radio"/> Yes
APD20C	Have you been in at least three car, work-related or other accidents?	<input type="radio"/> No <input type="radio"/> Yes
APD20D	Do you frequently engage in risky behaviors such as sharing needles or having unprotected sex with multiple partners?	<input type="radio"/> No <input type="radio"/> Yes
APD21A	During the past 5 years, have you been unemployed (and not a student or homemaker) for 6 months or more when you could have worked and work was available?	<input type="radio"/> No <input type="radio"/> Yes
APD21B	When you were working or were in school, were you often absent or late for reasons that were not due to illness or other legitimate excuses?	<input type="radio"/> No <input type="radio"/> Yes
APD21C	Have you owed people money and not paid them back when you were able to?	<input type="radio"/> No <input type="radio"/> Yes
APD21D	Have you failed to pay child support or provide for children or others who depended on you?	<input type="radio"/> No <input type="radio"/> Yes

APD21E	Has anyone ever said you were not taking good care of a child or endangering a child you were responsible for?	<input type="radio"/> No <input type="radio"/> Yes
APD22	Do you feel guilty or bad when you hurt other people or break the rules?	<input type="radio"/> No <input type="radio"/> Yes

Table B2: Risk Questions for Treatment Court Participants

Risk	Description	Answer Options
Risk 1	Current Age	
Risk 2	Age of onset of regular substance abuse	
Risk 3	Age of onset criminal activity	
Risk 4A	Number of address changes during the past 12 months	
Risk 4B	Homeless during the last 12 months)	<input type="radio"/> No <input type="radio"/> Yes
Risk 5	Number of months in past 12 months engaged in regular legal employment for 20 or more hours per week	
Risk 6A	Number of prior diversion programs or de novos referrals	
Risk 6B	Number of prior deferred prosecutions	
Risk 7	Number of prior substance abuse treatment episodes or attempts	
Risk 8	Number of prior bench warrants for failure to appear in past 3 years	
Risk 9A	Number of prior felony convictions	
Risk 9B	Number of prior serious misdemeanor convictions	
Risk 9C	Number of other misdemeanor convictions	
Risk 10	Amount of time during the past 12 months spent interacting with other people who are engaged in criminal activity, including illicit drug use	
Risk level	Overall risk level	<input type="radio"/> Low <input type="radio"/> Moderate <input type="radio"/> High
